Please find below and/or attached an Office communication concerning this application or proceeding.

DETAILED ACTION

1. This office action is in response to the amendment filed 17 January 2006.
2. In the amendment, Claims 1, 7, 13, and 17 have been amended. Claims 3, 9, 12, and 15 have been cancelled by the Applicant. The previous objection of drawings failing to comply with 37 CFR 1.84(p)(5) has been withdrawn as necessitated by the amendment. The objection of Claim 17 under Claim Objections has been withdrawn as necessitated by the amendment.
3. The previous rejection of Claims 1-17 under 35 U.S.C. 103(a) as being unpatentable over King et al (US Patent 5600775; 2/4/1997) in further view of Wallace et al (US PGPub 2002/0208112; filed 2/2/2001) has been withdrawn as necessitated by the amendment. The rejection of Claim 12 under 35 U.S.C. 112 has been withdrawn as necessitated by the amendment.
4. Claims 1-2, 4-8, 10-11, 13-14, and 16-17 are pending.

Drawings

5. The amendment to the specification filed on 17 January 2006 has made the drawings in compliance with 37 CFR 1.84(p)(5), and therefore accepted by the Examiner.

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 2178

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

7. Claims 1-2, 4-8, 10-11, 13-14, and 16-17 are rejected under 35 U.S.C. 103(a) as being unpatentable over King et al (US Patent 5600775; 2/4/1997) in further view of Wallace et al (USPGPub 2002/0208112; filed 2/2/2001) in further view of Iganami (US Patent #6,556,626, patented 4/29/2003)

As per independent Claim 1, King et al substantially discloses a method for annotating a frame said method comprising:

- receiving a data structure comprising representation of a first frame (Column 2, lines 35-37);
- processing a representation of the first frame (Column 2, lines 35-37);
- creating a graphic (Column 2, lines 49-51),
- annotating the graphic and the first frame, thereby resulting in a second frame. (Column 2, lines 31-34)

King et al discloses created annotations that include free-hand bitmap drawings (graphics). In addition, Applicant discloses the graphic displays at least one parameter. In the specification, Applicant disclose a parameter that consists of decode time or presentation time. Thus, the graphic displays time information. King et al discloses that such video frames are indexed by frame number and uses the example, QuickTime, having its index as a video time parameter.

King et al states "digital frames ...are annotated with text, graphics, and digital audio without modifications to the original video information." King et al's disclosure is

Art Unit: 2178

equivalent which a second frame is created with the annotation since the original video information (frame) is unaltered.

King et al fails to specifically disclose compressing and decompressing data frames. However, King et al mentions in, e.g. Column 1, lines 35 & 64, that data files are huge and required some form of data reduction for efficient data processing. Accordingly, Wallace et al discloses a process of generating annotations wherein data frames are compressed to be subsequently decompressed based on MPEG standard in paragraph 0026, line 3.

It would have been obvious to one of the ordinary skill in the art at the time of the Applicant's invention to modify King et al's annotation method by including therein data compression and decompression means with full motion digital video frames. One of the ordinary skill in the art at the time of the Applicant's invention would have known that full motion digital video frames can be compressed for optimizing cost and use of less hardware; therefore, would have used Wallace et al's process prior to using King et al's annotation method.

King et al and Wallace et al further fail to specifically disclose that a representation of a frame includes at least one parameter wherein the parameter comprises a decoding time information and a presentation time information, and wherein the decoding time information and the presentation time information are different. However, Applicant discloses within the specification on the well known MPEG standard specifying that it includes decode time stamp and presentation time stamp parameters.

It would have been obvious to one of the ordinary skill in the art at the time of the Applicant's invention to know using King et al's annotation method with full motion digital video frames and other index structures to include the MPEG video format based on its standards, since Applicant's disclosure that the time information parameters are a MPEG standard. One of the ordinary skill in the art at the time of the Applicant's invention of annotating video would have used the MPEG format for its video and time attributes.

However, Applicant's disclosure of prior art of the MPEG standard including of decode time and presentation time parameter fail to specifically the details disclosing the difference between the decoding time and presentation time information. On the other hand, Iganami discloses details by defining what a presentation time stamp (Column 1, lines 42-43) and a decoding time stamp is (Column 1, lines 44-45), wherein each definition shows the difference between the decoding time and presentation time information.

It would have been obvious to one of ordinary skill in the art at the time of Applicant's invention to have combined King et al, Wallace et al, and the well known MPEG standards, with Iganami's disclosure of details of decoding time stamp and presentation time stamp since it would have provided the user benefit of flexibility and use of ease during video editing with multiple time indicators.

As per dependent Claim 2, King et al discloses that it is inherent that a simple scaling is done at a 1:1 ratio to the size of the original frame when the second frame is created by annotation.

As per dependent Claim 4, King et al fails to disclose that the graphic is selected from a group consisting of a header, a footer, and a margin. However, Wallace et al discloses, e.g. Figure 3 and 4 and paragraph 0037, that the frame includes a header, and a footer.

It would have been obvious to one of the ordinary skill in the art at the time of the Applicant's invention to use King et al's annotation method of with Wallace et al's sample frame, within a data structure, that includes a header, which uniquely identifies the frame (paragraph 0037) since it would have allowed a user to identify the position of a header and its purpose for annotating display time or text without stealing focus of the main intention of the frame.

As per dependent Claim 5, King et al further discloses "an annotation manager includes resources to select in response to user input an indexed data structure to be annotated and resources to create, in response to user input, an annotation data structure." (Column 2, lines 64-67) King et al's statement is equivalent that a number of parameters are present and receives an indication to user input or selecting a parameter.

As per dependent Claim 6, King et al further discloses that "a graphical user interface is provided having a window for displaying the indexed data structures" and an annotation control window that includes graphical user elements providing access to tools for providing user input, frame selection for annotation, and annotation creation. (Column 2, paragraph 3) In addition, Column 2, line 64 – Column 3, line 1, disclose an indication when the user inputs data.

As per independent Claim 7, Claim 7 recites similar limitations as in Claim 1 and is rejected under rationale. Furthermore, King et al discloses a decoder for annotating a frame, said decoder comprising:

- memory for storing a data structure, the data structure comprising a compressed representation of a first frame and at least one parameter; (FIG 1, block 14)
- frame buffer for storing a second frame, the second frame comprising the first frame and the graphic. (Column 6, lines 51- Column 7, line 11; FIG 1, block 12).

King et al fails to specifically disclose a decompression engine. However, referring to the rejection of Claim 1 and the rationale incorporated herein, wherein King et al and Wallace et al discloses an annotation method wherein data frames are compressed to be subsequently decompressed. Furthermore, a decompression engine is inherently present to perform the functionality of Wallace et al's disclosure since Wallace et al teaches the functionality of a decompression scheme of MPEG-2.

As per dependent claim 8, King et al further discloses a display controller (FIG 1, block 12) that "drives a monitor displaying a graphic user interface" (Column 4, lines 5-9) which inherently contains the scaling capability of a frame based on the rejection of claim 2.

As per dependent claim 10, Claim 10 recites similar limitations as in Claim 4 and is rejected under rationale.

As per dependent claim 11, King et al further discloses a processor is included in Figure 1, block 10, which performs the indication previously rejected in Claim 5.

As per independent claim 13, Claim 13 recites similar limitations as in Claims 1 and 7 combined and is rejected under rationale. Furthermore King et al discloses a decoder for annotating a frame, said decoder comprising:

- memory storing a data structure, the data structure comprising a compressed representation of a first frame and at least one parameter; (FIG 1)
- a decompression engine connected to the memory; and

Based on the rejection of the decompression engine in claim 7 and the rationale incorporated within, the decompression engine is inherently connected to the memory since data is transported throughout by computer signals based on system in King et al (FIG 1) in order perform the decompression functionality.

- a frame buffer connected to the decompression engine, wherein the frame buffer stores a second frame, the second frame comprising the first frame and a graphic created by the decompression engine, said graphic displaying the at least one parameter, wherein the parameter comprises a decoding time information and a presentation time information, and wherein the decoding time information and the presentation time information are different.

Based on the rejection of the decompression engine in claim 7 and the rationale incorporated within, the decompression engine is inherently connected to the frame buffer since data is transported throughout by computer signals based on system in King et al (FIG 1) in order perform the decompression functionality.

Art Unit: 2178

As per dependent claim 14, King et al further discloses in FIG 1, block 12, that the display engine, rejected base on King et al's display controller, is connected to the frame buffer.

As per dependent claim 16, Claim 16 recites similar limitations as in Claim 4 and is rejected under rationale.

As per dependent claim 17, a processor is inherently connected to all computers components and engines of a system based on King et al's Figure 1 since data is transported back and forth throughout by computer signals.

Response to Arguments

8. Applicant's arguments with respect to claims 1,7, and 13, have been considered but are moot in view of the new ground(s) of rejection.

As detailed above, the Iganami reference has been added to address the amended limitation. Applicant amended the independent claims to change the scope of the limitations by limiting the parameters to be comprising either a decoding time information or a presentation time information, thus the Iganami reference was added to necessitate the new grounds.

Conclusion

9. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP

Art Unit: 2178

§ 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to David Faber whose telephone number is 571-272-2751. The examiner can normally be reached on M-F from 8am to 430pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Stephen Hong, can be reached on 571-272-4124. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

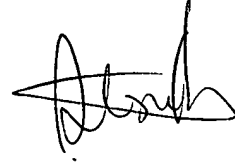

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should
